DETAILED ACTION

Election/Restrictions

Claims 22-42 withdrawn from further consideration pursuant to 37 CFR 1.142(b), as being drawn to a nonelected Group II, there being no allowable generic or linking claim. Applicant timely traversed the restriction (election) requirement in the reply filed on 12/17/07. The Applicant argues, there would be no serious burden to the Examiner to include claims 22-42 in the search. The Examiner maintains that since it has been shown that Group II is classified in a different class than Group I it would create a serious burden on the Examiner.

Claim Objections

Claims 7-14 are objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim should refer to other claims in the alternate only. See MPEP § 608.01(n). Accordingly, the claims 7-14 have not been further treated on the merits.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-6 and 15-21 are rejected under 35 U.S.C. 102(b) as being anticipated by Evans (USPN 6,283,440).

Evans discloses a bubble generation mechanism that produces a bubble within the bubble confinement region. The bubble displaces the movable structure (creating a micropump) and alters the configuration of the bias mechanism, thereby producing useful work. The first phase involves creating a bubble from a liquid (reaction agent), as the bubble expands it performs useful work on the bias mechanism 24, forcing the sliding block 22 into an open channel position. The heat from a heater (reaction initiation means) forms a thermal vapor bubble in the bubble confinement chamber 28, where the thermal bubble continuously evaporates and condenses fluid. When the heater is turned off, the vapor bubble re-condenses but the previously dissolved gases remain forming a stable gas bubble. Referring to figure 6 and 7, one can see that the pump structural material and the reaction initiation means (heater) are stacked one on top of the other. Regarding claim 6, Evans discloses chemical reactions (2 chemicals) can also be used to form a stable bubble. Evans discloses a control section for controlling the operation of said reaction initiation section (turning heater on and off).
